Temporarily add the LXD DNS server to your host machine.

vendredi 14 juin 2024, par [placido](#)

First, add the DNS server of lxdbr0.

```
sudo resolvectl dns lxdbr0 $(ip -f inet addr show lxdbr0 | sed -En -e 's/.*inet ([0-9.]+).*/\1/p')
```

Second, make sure all requests to *.lxd are sent to that DNS server.

```
sudo resolvectl domain lxdbr0 lxd
```

After this, any requests to containername.lxd will be resolved to the container IP address. Make sure to add .lxd to the hostname.
